

WEIGHTED NORLUND-EULER A-STATISTICAL CONVERGENCE FOR SEQUENCES OF POSITIVE LINEAR OPERATORS

Elida Hoxha¹, Ekrem Aljimi² and Valdete Loku³

Abstract. We introduce the notion of weighted Norlund –Euler A-Statistical Convergence of a sequence, where A represents the nonnegative regular matrix. We also prove the Korovkin approximation theorem by using the notion of weighted Norlund-Euler A-statistical convergence. Further, we give a rate of weighted Norlund-Euler A-statistical convergence.

1. BACKGROUND, NOTATIONS AND PRELIMINARIES

Suppose that $E \subseteq N = \{1, 2, \dots\}$ and $E_n = \{k \leq n : k \in E\}$. Then

$$\delta(E) = \lim_{n \rightarrow \infty} \frac{1}{n} |E_n| \quad (1)$$

is called the natural density of E provided that the limit exist, where $|\cdot|$ represents the number of elements in the enclosed set.

The term “statistical convergence” was first presented by Fast [1] which is generalization of the concept of ordinary convergence. Actually, a root of the notion of statistical convergence can be detected by Zygmund [2] (also see [3]), where he used the term ‘almost convergence’ which turned out to be equivalent to the concept of statistical convergence. The notion of Fast was further investigated by Schoenberg [4], Salat [5], Fridy [6], and Conner [7].

The following notion is due to Fast [1]. A sequence $x = (x_k)$ is said to be statistically convergent to L if $\delta(K_\varepsilon) = 0$ for every $\varepsilon > 0$, where

$$K_\varepsilon = \{k \in N : |x_k - L| \geq \varepsilon\} \quad (2)$$

equivalently,

$$\lim_{n \rightarrow \infty} \frac{1}{n} |\{k \leq n : |x_k - L| \geq \varepsilon\}| = 0. \quad (3)$$

In symbol, we will write $S\text{-}\lim x = L$. We remark that every convergent sequence is statistically convergent but not conversely.

Let X and Y be two sequence spaces and let $A = (a_{n,k})$ be an infinite matrix. If for each $x = (x_k)$ in X the series

$$A_n x = \sum_k a_{n,k} x_k = \sum_{k=1}^{\infty} a_{n,k} x_k \tag{4}$$

converges for each $n \in N$ and the sequence $Ax = A_n x$ belongs to Y , then we say the matrix A maps X to Y . By the symbol (X, Y) we denote the set of all matrices which map X into Y .

A matrix A (or a matrix map A) is called regular if $A \in (c, c)$, where the symbol c denotes the spaces of all convergent sequences and

$$\lim_{n \rightarrow \infty} A_n x = \lim_{k \rightarrow \infty} x_k \tag{5}$$

for all $x \in c$. The well-known Silverman-Toeplitz theorem (see [8]) assert that $A = (a_{n,k})$ is regular if and only if

- i) $\lim_n a_{n,k} = 0$ for each k ;
- ii) $\lim_n \sum_k a_{n,k} = 1$;
- iii) $\sup_n \sum_k |a_{n,k}| < \infty$.

Kolk [9] extended the definition of statistical convergence which the help of nonnegative regular matrix $A = (a_{n,k})$ calling it A -statistical convergence. The definition of A -statistical convergence is given by Kolk as follows. For any nonnegative regular matrix A , we say that a sequence is A -statistically convergent to L provided that for every $\varepsilon > 0$ we have

$$\lim_{n \rightarrow \infty} \sum_{k: |x_k - L| \geq \varepsilon} a_{n,k} = 0 \tag{6}$$

In 2009, the concept of weighted statistical convergence was defined and studied by Karakaya and Chishti [10] and further modified by Mursaleen et al. [11] in 2012. In 2013, Belen and Mohiuddine [12] presented a generalization of this notion through de la Vallee-Poussin mean in probabilistic normed spaces.

Let $\sum_{k=0}^n x_n$ be a given infinite series with sequence of its n^{th} partial sum $\{S_n\}$. If $(E, 1)$ transform is defined as

$$E_n^1 = \frac{1}{2^n} \sum_{k=0}^n \binom{n}{k} S_k \tag{7}$$

and we say that this summability method is convergent if $E_n^1 \rightarrow S$ as $n \rightarrow \infty$. In this case we say the series $\sum_{k=0}^n x_n$ is $(E, 1)$ - summable to a definite number S . (Hardy [31]).

And we will write $S_n \rightarrow S(E, 1)$ as $n \rightarrow \infty$.

Let (p_n) and (q_n) be the two sequences of non-zero real constants such that

$$P_n = p_0 + p_1 + \dots + p_n, P_{-1} = p_{-1} = 0$$

$$Q_n = q_0 + q_1 + \dots + q_n, Q_{-1} = q_{-1} = 0$$

For the given sequences (p_n) and (q_n) , convolution $p * q$ is defined by:

$$R_n = p * q = \sum_{k=0}^n p_k q_{n-k} \tag{8}$$

The series $\sum_{k=0}^n x_n$ or the sequence $\{S_n\}$ is summable to S by generalized Norlund method and it is denoted by $S_n \rightarrow S(N, p, q)$ if

$$t_n^{p,q} = \frac{1}{R_n} \sum_{v=0}^n p_{n-v} q_v S_v \tag{9}$$

tends to S as $n \rightarrow \infty$.

Let us use in consideration the following method of summability:

$$t_n^{p,q,E} = \frac{1}{R_n} \sum_{k=0}^n p_{n-k} q_k E_k^1 = \frac{1}{R_n} \sum_{k=0}^n p_{n-k} q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} S_v \tag{10}$$

If $t_n^{p,q,E} \rightarrow S$ as $n \rightarrow \infty$, then we say that the series $\sum_{k=0}^n x_n$ or the sequence $\{S_n\}$ is summable to S by Norlund-Euler method and it is denoted by $S_n \rightarrow S(N, p, q)(E, 1)$.

Remark 1. If $p_k = 1, q_k = 1$, then we get Euler summability method.

Now we are able to give the definition of the weighted statistical convergence related to the $(N, p, q)(E, 1)$ – summability method.

We say that E have weighted density, denoted by $\delta_{NE}(E)$, if

$$\delta_{NE}(E) = \lim_{n \rightarrow \infty} \frac{1}{R_n} |\{k \leq R_n : k \in E\}| \tag{11}$$

A sequence $x = (x_k)$ is said to be weighted Norlund-Euler statistical convergent (or S_{NE} – convergent) if for every $\varepsilon > 0$:

$$\lim_{n \rightarrow \infty} \frac{1}{R_n} |\{k \leq R_n : p_{n-k} q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} |x_v - L| \geq \varepsilon\}| = 0 \tag{12}$$

In these case we write $L = S_{NE}(st) - \lim x$.

In the other hand, let us recall that $C[a, b]$ is the space of all functions f continuous on $[a, b]$. We know that $f \in C[a, b]$ is Banach spaces with norm

$$\|f\|_{\infty} = \sup_{x \in [a, b]} |f(x)|, f \in C[a, b] \tag{13}$$

Suppose that L is a linear operator from $C[a, b]$ into $C[a, b]$. It is clear that if $f \geq 0$ implies $Lf \geq 0$, then the linear operator L is positive on $C[a, b]$. We denote the value of Lf at a point $x \in [a, b]$ by $L(f; x)$. The classical Korovkin approximation theorem states the following [14].

Theorem 2. Let (T_n) be a sequence of positive linear operators from $C[a, b]$ into $C[a, b]$. Then,

$$\lim_{n \rightarrow \infty} \|T_n(f; x) - f(x)\|_{\infty} = 0 \quad (14)$$

for all $C[a, b]$ if only if

$$\lim_{n \rightarrow \infty} \|T_n(f_i; x) - f_i(x)\|_{\infty} = 0 \quad (15)$$

where $f_i(x) = x^i$ and $i = 0, 1, 2$.

Many mathematicians extended the Korovkin-type approximation theorems by using various test functions in several setups, including Banach spaces, abstract Banach lattices, function spaces, and Banach algebras. Firstly, Gadjiev and Orhan [15] established classical Korovkin theorem through statistical convergence and display an interesting example in support of our result. Recently, Korovkin-type theorems have been obtained by Mohiuddine [16] for almost convergence. Korovkin-type theorems were also obtained in [17] for λ -statistical convergence. The authors of [18] established these types of approximation theorem in weighted L_p spaces, where $1 \leq p < \infty$, through A -summability which is stronger than ordinary convergence. For these types of approximation theorems and related concepts, one can be referred to [19–29] and references therein.

2. KOROVKIN-TYPE THEOREMS BY WEIGHTED NORLUND-EULER A-STATISTICAL CONVERGENCE

Kolk [9] introduced the notion of A -statistical convergence by considering nonnegative regular matrix A instead of Cesáro matrix in the definition of statistical convergence due to Fast. Inspired from the work of S. A. Mohiuddine, Abdullah Alotaibi, and Bipan Hazarika [30] we introduce the notion of weighted Norlund-Euler A -statistical convergence of a sequence and then we establish some Korovkin-type theorems by using this notion.

Definition 3. Let $A = (a_{n,k})$ be a nonnegative regular matrix. A sequence $x = (x_k)$ of real or complex numbers is said to be weighted Norlund-Euler A -statistical convergence, denoted by S_A^{NE} -convergent, to L if for every $\varepsilon > 0$

$$\lim_{n \rightarrow \infty} \sum_{k \in E(p, \varepsilon)} a_{n,k} = 0 \quad (16)$$

where

$$E(p, \varepsilon) = \{k \in N : p_{n-k} q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} |x_v - L| \geq \varepsilon\} \quad (17)$$

In symbol, we will write $S_A^{NE} - \lim x = L$.

Remark 4. Note that convergence sequence implies weighted Norlund-Euler A - statistical convergent to the same value but converse is not true in general. For example, take $p_k = 1, q_k = 1$ for all k and define a sequence $x = (x_k)$ by

$$x_k = \begin{cases} 1, & \text{if } k = n^2 \\ 0, & \text{otherwise} \end{cases} \quad (18)$$

where $n \in N$. Then this sequence is statistically convergent to 0 but not convergent; in this case, weighted Norlund-Euler A -statistical convergence of a sequence coincides with statistical convergence.

Theorem 5. Let $A = (a_{n,k})$ be a nonnegative regular matrix. Consider a sequence of positive linear operators (M_k) from $C[a, b]$ into itself. Then, for all $f \in C[a, b]$ bounded on whole real line,

$$S_A^{NE} - \lim_{k \rightarrow \infty} \|M_k(f; x) - f(x)\|_{\infty} = 0 \quad (19)$$

if only if

$$\begin{aligned} S_A^{NE} - \lim_{k \rightarrow \infty} \|M_k(1; x) - 1\|_{\infty} &= 0, \\ S_A^{NE} - \lim_{k \rightarrow \infty} \|M_k(v; x) - v\|_{\infty} &= 0, \\ S_A^{NE} - \lim_{k \rightarrow \infty} \|M_k(v^2; x) - v^2\|_{\infty} &= 0 \end{aligned} \quad (20)$$

Proof. Equation (20) directly follows from (19) because each of $1, x, x^2$ belongs to $C[a, b]$. Consider a function $f \in C[a, b]$. Then there is a constant $C > 0$ such that $|f(x)| \leq C$ for all $x \in (-\infty, +\infty)$. Therefore,

$$|f(v) - f(x)| \leq 2C, \quad -\infty < v, x < +\infty, \quad (21)$$

Let $\varepsilon > 0$ be given. By hypothesis there is a $\delta = \delta(\varepsilon) > 0$ such that

$$|f(v) - f(x)| < \varepsilon, \quad \forall |v - x| < \delta \quad (22)$$

Solving (21) and (22) and then substituting $\Omega(v) = (v - x)^2$, one obtains

$$|f(v) - f(x)| < \varepsilon + \frac{2C}{\delta^2} \Omega. \quad (23)$$

Equation (23) can be also written by as

$$-\varepsilon - \frac{2C}{\delta^2} \Omega < f(v) - f(x) < \varepsilon + \frac{2C}{\delta^2} \Omega. \quad (24)$$

Operating $M_k(1; x)$ to (24) since $M_k(f; x)$ his linear and monoton, one obtains

$$M_k(1; x)(-\varepsilon - \frac{2C}{\delta^2} \Omega) < M_k(1; x)(f(v) - f(x)) < M_k(1; x)(\varepsilon + \frac{2C}{\delta^2} \Omega) \quad (25)$$

Note that x is fixed, so $f(x)$ is constant number. Thus, we obtain from (25) that

$$-\varepsilon M_k(1; x) - \frac{2C}{\delta^2} M_k(\Omega; x) < M_k(f; x) - f(x) M_k(1; x) < \varepsilon M_k(1; x) + \frac{2C}{\delta^2} M_k(\Omega; x) \quad (26)$$

The term " $M_k(f; x) - f(x)M_k(1; x)$ " in (26) can also written as

$$M_k(f; x) - f(x)M_k(1; x) = M_k(f; x) - f(x) - f(x)[M_k(1; x) - 1] \quad (27)$$

Now substituting the value of $M_k(f; x) - f(x)M_k(1; x)$ in (26), we get that

$$M_k(f; x) - f(x) < \varepsilon M_k(1; x) + \frac{2C}{\delta^2} M_k(\Omega; x) + f(x)[M_k(1; x) - 1] \quad (28)$$

We can rewrite the term " $M_k(\Omega; x)$ " in (28) as follows:

$$\begin{aligned} M_k(\Omega; x) &= M_k((v-x)^2; x) = M_k(v^2; x) + 2xM_k(v; x) + x^2M_k(1; x) \\ &= [M_k(v^2; x) - x^2] - 2x[M_k(v; x) - x] + x^2[M_k(1; x) - 1] \end{aligned} \quad (29)$$

Equation (28) with the above value of $M_k(\Omega; x)$ becomes

$$\begin{aligned} M_k(f; x) - f(x) &< \varepsilon M_k(1; x) + \frac{2C}{\delta^2} \{ [M_k(v^2; x) - x^2] + 2x[M_k(v; x) - x] \\ &\quad + x^2[M_k(1; x) - 1] \} + f(x)[M_k(1; x) - 1] \\ &= \varepsilon [M_k(1; x) - 1] + \varepsilon + \frac{2C}{\delta^2} \{ [M_k(v^2; x) - x^2] + 2x[M_k(v; x) - x] \\ &\quad + x^2[M_k(1; x) - 1] \} + f(x)[M_k(1; x) - 1] \end{aligned} \quad (30)$$

Therefore,

$$\begin{aligned} |M_k(f; x) - f(x)| &\leq (\varepsilon + \frac{2Cb^2}{\delta^2} + C) |M_k(1; x) - 1| \\ &\quad + \frac{2C}{\delta^2} |M_k(v^2; x) - x^2| \\ &\quad + \frac{4Cb}{\delta^2} |M_k(v; x) - x| \end{aligned} \quad (31)$$

where $b = \max |x|$. Taking supremum over $x \in [a, b]$, one obtains

$$\begin{aligned} \|M_k(f; x) - f(x)\|_\infty &\leq (\varepsilon + \frac{2Cb^2}{\delta^2} + C) \|M_k(1; x) - 1\|_\infty \\ &\quad + \frac{2C}{\delta^2} \|M_k(v^2; x) - x^2\|_\infty \\ &\quad + \frac{4Cb}{\delta^2} \|M_k(v; x) - x\|_\infty \end{aligned} \quad (32)$$

or

$$\begin{aligned} \|M_k(f; x) - f(x)\|_\infty &\leq T \{ \|M_k(1; x) - 1\|_\infty \\ &\quad + \|M_k(v^2; x) - x^2\|_\infty \\ &\quad + \|M_k(v; x) - x\|_\infty \} \end{aligned} \quad (33)$$

where

$$T = \max\{\varepsilon + \frac{2Cb^2}{\delta^2} + C, \frac{2C}{\delta^2}, \frac{4Cb}{\delta^2}\}. \quad (34)$$

Hence

$$\begin{aligned} p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} \|M_k(f; x) - f(x)\|_{\infty} &\leq T \{ p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} \|M_k(1; x) - 1\|_{\infty} \\ &\quad + p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} \|M_k(v^2; x) - x^2\|_{\infty} \\ &\quad + p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} \|M_k(v; x) - x\|_{\infty} \} \end{aligned} \quad (35)$$

For given $\alpha > 0$, choose $\varepsilon > 0$ such that $\varepsilon < \alpha$, and we will define the following sets:

$$\begin{aligned} E &= \{k \in N : p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} \|M_k(f; x) - f(x)\|_{\infty} \geq \alpha\} \\ E_1 &= \{k \in N : p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} \|M_k(1, x) - 1\|_{\infty} \geq \frac{\alpha - \varepsilon}{3T}\} \\ E_2 &= \{k \in N : p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} \|M_k(v; x) - x\|_{\infty} \geq \frac{\alpha - \varepsilon}{3T}\} \\ E_3 &= \{k \in N : p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} \|M_k(v^2; x) - x^2\|_{\infty} \geq \frac{\alpha - \varepsilon}{3T}\} \end{aligned} \quad (36)$$

It easy to see that

$$E \subset E_1 \cup E_2 \cup E_3 \quad (37)$$

Thus, for each $n \in N$, we obtain from (35) that

$$\sum_{k \in E} a_{n,k} \leq \sum_{k \in E_1} a_{n,k} + \sum_{k \in E_2} a_{n,k} + \sum_{k \in E_3} a_{n,k} \quad (38)$$

Taking limit $n \rightarrow \infty$ in (38) and also (20) gives that

$$\lim_{n \rightarrow \infty} \sum_{k \in E} a_{n,k} = 0. \quad (39)$$

These yields that

$$S_A^{NE} - \lim_{k \rightarrow \infty} \|M_k(f; x) - f(x)\|_{\infty} = 0 \quad (40)$$

for all $f \in C[a, b]$.

We also obtain the following Korovkin-type theorem for weighted Norlund-Euler statistical convergence instead of nonnegative regular matrix A in Theorem 5.

Theorem 6. Consider a sequence of positive linear operators (M_k) from $C[a, b]$ into itself. Then, for all $f \in C[a, b]$ bounded on whole real line,

$$S_{NE} - \lim_{k \rightarrow \infty} \|M_k(f; x) - f(x)\|_{\infty} = 0 \quad (41)$$

if only if

$$S_{NE} - \lim_{k \rightarrow \infty} \|M_k(1; x) - 1\|_{\infty} = 0 \tag{42}$$

$$S_{NE} - \lim_{k \rightarrow \infty} \|M_k(\nu; x) - x\|_{\infty} = 0 \tag{43}$$

$$S_{NE} - \lim_{k \rightarrow \infty} \|M_k(\nu^2; x) - x^2\|_{\infty} = 0 \tag{44}$$

Proof. Following the proof of Theorem 5, one obtains

$$E \subset E_1 \cup E_2 \cup E_3 \tag{45}$$

and so

$$\delta_{NE}(E) \subset \delta_{NE}(E_1) + \delta_{NE}(E_2) + \delta_{NE}(E_3) \tag{46}$$

Equations (42)-(44) give that

$$S_{NE} - \lim_{k \rightarrow \infty} \|M_k(f; x) - f(x)\|_{\infty} = 0. \tag{47}$$

Remark 7. By the Theorem 2 of [32], we have that if a sequence $x = (x_k)$ is weighted Norlun-Euler statistically convergent to L , then it is strongly $(N, p, q)(E, 1)$ -summable to L , provided that $p_{n-k}q_k \frac{1}{2^k} \sum_{\nu=0}^k \binom{k}{\nu} |x_k - L|$ is bounded; that is, there exist a constant C such that

$$p_{n-k}q_k \frac{1}{2^k} \sum_{\nu=0}^k \binom{k}{\nu} |x_k - L| \leq C$$

for all $k \in N$. We write

$$|(N, p, q)(E, 1)| = \{x = x_n : \lim_{n \rightarrow \infty} \frac{1}{R_n} \sum_{k=0}^n p_{n-k}q_k \frac{1}{2^k} \sum_{\nu=0}^k \binom{k}{\nu} |x_{\nu} - L| = 0 \text{ for some } L\} \tag{48}$$

the set of all sequences $x = (x_k)$ which are strongly $(N, p, q)(E, 1)$ -summable to L .

Theorem 8. Let $M_k : C[a, b] \rightarrow C[a, b]$ be a sequence of positive linear operators which satisfies (43)-(44) of Theorem 6 and the following conditions holds:

$$\lim_{k \rightarrow \infty} \|M_k(1; x) - 1\|_{\infty} = 0. \tag{49}$$

Then,

$$\lim_{n \rightarrow \infty} \frac{1}{R_n} \sum_{k=0}^n p_{n-k}q_k \frac{1}{2^k} \sum_{\nu=0}^k \binom{k}{\nu} \|M_k(f; x) - f(x)\|_{\infty} = 0, \tag{50}$$

for any $f \in C[a, b]$.

Proof. It follow from (49) that $\|M_k(f; x)\|_{\infty} \leq C'$, for some constant $C' > 0$ and for all $k \in N$. Hence for $f \in C[a, b]$, one obtains

$$\begin{aligned}
 p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} \|M_k(f; x) - f(x)\|_\infty &\leq p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} (\|f\|_\infty \|M_k(1; x)\|_\infty + \|f\|_\infty) \\
 &\leq p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} C(C'+1).
 \end{aligned}
 \tag{51}$$

Right hand side of (51) is constant, so

$$p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} \|M_k(f; x) - f(x)\|_\infty$$

is bounded. Since (49) implies (42), by Theorem 6 we get that

$$S_{NE} - \lim_{k \rightarrow \infty} \|M_k(f; x) - f(x)\|_\infty = 0.
 \tag{52}$$

By remark 7, (51) and (52) together give the desired result.

3. RATE OF WEIGHTED NORLUND-EULER A-STATISTICAL CONVERGENCE

First we define the rate of weighted Norlund-Euler A-statistical convergent sequence as follows.

Definition 9. Let $A = (a_{n,k})$ be a nonnegative regular matrix and let (a_k) be a positive non increasing sequence. Then, a sequence $x = (x_k)$ is weighted Norlund-Euler A-statistical convergent to L with the rate of $o(a_k)$ if for each $\varepsilon > 0$

$$\lim_{n \rightarrow \infty} \frac{1}{a_n} \sum_{k \in E(p, \varepsilon)} a_{n,k} = 0
 \tag{53}$$

where

$$E(p, \varepsilon) = \{k \in N : p_{n-k}q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} |x_v - L| \geq \varepsilon\}
 \tag{54}$$

In symbol, we will write

$$x_k - L = S_A^{NE} - o(a_k) \text{ as } k \rightarrow \infty
 \tag{55}$$

We will prove the following auxiliary result by using the above definition.

Lemma 10. Let $A = (a_{n,k})$ be a nonnegative regular matrix. Suppose that (a_k) and (b_k) are two positive nonincreasing sequences. Let $x = (x_k)$ and $y = (y_k)$ be two sequences such that

$$x_k - L_1 = S_A^{NE} - o(a_k) \text{ and } y_k - L_2 = S_A^{NE} - o(b_k).$$

Then,

- (i) $(x_k - L_1) \pm (y_k - L_2) = S_A^{NE} - o(c_k),$
- (ii) $(x_k - L_1)(y_k - L_2) = S_A^{NE} - o(a_k b_k),$

(iii) $\alpha(x_k - L_1) = S_A^{NE} - o(a_k)$, for any scalar α ,

where $c_k = \max\{a_k, b_k\}$.

Proof. Suppose that

$$x_k - L_1 = S_A^{NE} - o(a_k), \quad y_k - L_2 = S_A^{NE} - o(b_k) \quad (56)$$

Given $\varepsilon > 0$, define

$$\begin{aligned} E' &= \{k \in N : p_{n-k} q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} |(x_k - L_1) \pm (y_k - L_2)| \geq \varepsilon\} \\ E'' &= \{k \in N : p_{n-k} q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} |x_k - L_1| \geq \frac{\varepsilon}{2}\} \\ E''' &= \{k \in N : p_{n-k} q_k \frac{1}{2^k} \sum_{v=0}^k \binom{k}{v} |y_k - L_2| \geq \frac{\varepsilon}{2}\} \end{aligned} \quad (57)$$

It easy to see that

$$E' \subset E'' \cup E''' \quad (58)$$

These yields that

$$\frac{1}{c_n} \sum_{k \in E'} a_{n,k} \leq \frac{1}{c_n} \sum_{k \in E''} a_{n,k} + \frac{1}{c_n} \sum_{k \in E'''} a_{n,k} \quad (59)$$

holds for all $n \in N$. Since $c_k = \max\{a_k, b_k\}$, (59) gives that

$$\frac{1}{c_n} \sum_{k \in E'} a_{n,k} \leq \frac{1}{a_n} \sum_{k \in E''} a_{n,k} + \frac{1}{b_n} \sum_{k \in E'''} a_{n,k} \quad (60)$$

Taking limit $n \rightarrow \infty$ in (60) together with (56), we obtain

$$\lim_{n \rightarrow \infty} \frac{1}{c_n} \sum_{k \in E'} a_{n,k} = 0 \quad (61)$$

Thus,

$$(x_k - L_1) \pm (y_k - L_2) = S_A^{NE} - o(c_k) \quad (62)$$

Similarly, we can prove (ii) and (iii).

Now, we recall the notion of modulus of continuity of f in $C[a, b]$ is defined by

$$\omega(f, \delta) = \sup\{|f(x) - f(y)| : x, y \in [a, b], |x - y| < \delta\} \quad (63)$$

It is well known that

$$|f(x) - f(y)| \leq \omega(f, \delta) \left(\frac{|x-y|}{\delta} + 1 \right). \quad (64)$$

Theorem 11. Let $A = (a_{n,k})$ be a nonnegative regular matrix. If the sequence of positive linear operators $M_k : C[a, b] \rightarrow C[a, b]$ satisfies the conditions

- (i) $\|M_k(1; x) - 1\|_\infty = S_A^{NE} - o(a_k)$,
- (ii) $\omega(f, \lambda_k) = S_A^{NE} - o(b_k)$, with $\lambda_k = \sqrt{M_k(\varphi_x; x)}$ and $\varphi_x(y) = (y - x)^2$,

where (a_k) and (b_k) are two positive nonincreasing sequences, then

$$\|M_k(f; x) - f(x)\|_\infty = S_A^{NE} - o(c_k) \quad (65)$$

for all $f \in C[a, b]$, where $c_k = \max\{a_k, b_k\}$.

Proof. Equation (27) can be reformed into the following form:

$$\begin{aligned} |M_k(f; x) - f(x)| &\leq M_k(|f(x) - f(y)|; x) + |f(x)| \cdot |M_k(1; x) - 1| \\ &\leq M_k(1 + \frac{|y-x|}{\delta}; x) \omega(f, \delta) + |f(x)| \cdot |M_k(1; x) - 1| \\ &\leq M_k(1 + \frac{(y-x)^2}{\delta^2}; x) \omega(f, \delta) + |f(x)| \cdot |M_k(1; x) - 1| \\ &\leq (M_k(1; x) + \frac{1}{\delta^2} M_k(\varphi_x; x)) \omega(f, \delta) + |f(x)| \cdot |M_k(1; x) - 1| \\ &\leq |M_k(1; x) - 1| \omega(f, \delta) + |f(x)| \cdot |M_k(1; x) - 1| + \omega(f, \delta) + \frac{1}{\delta^2} M_k(\varphi_x; x) \omega(f, \delta) \end{aligned} \quad (66)$$

Choosing $\delta = \lambda_k = \sqrt{M_k(\varphi_x; x)}$, one obtains

$$\|M_k(f; x) - f(x)\|_\infty \leq T \|M_k(1; x) - 1\|_\infty + 2\omega(f, \lambda_k) + \|M_k(1; x) - 1\|_\infty \omega(f, \lambda_k) \quad (67)$$

where $T = \|f\|_\infty$. For given $\varepsilon > 0$, we will define the following sets:

$$\begin{aligned} E_1' &= \{k \in N : p_{n-k} q_k \frac{1}{2^k} \sum_{\nu=0}^k \binom{k}{\nu} \|M_k(f; x) - f(x)\|_\infty \geq \varepsilon\} \\ E_2' &= \{k \in N : p_{n-k} q_k \frac{1}{2^k} \sum_{\nu=0}^k \binom{k}{\nu} \|M_k(1; x) - 1\|_\infty \geq \frac{\varepsilon}{3T}\} \\ E_3' &= \{k \in N : p_{n-k} q_k \frac{1}{2^k} \sum_{\nu=0}^k \binom{k}{\nu} \omega(f, \lambda_k) \geq \frac{\varepsilon}{6}\} \\ E_4' &= \{k \in N : p_{n-k} q_k \frac{1}{2^k} \sum_{\nu=0}^k \binom{k}{\nu} \omega(f, \lambda_k) \|M_k(1; x) - 1\|_\infty \geq \frac{\varepsilon}{3}\}. \end{aligned} \quad (68)$$

It follow from (67) that

$$\frac{1}{c_n} \sum_{k \in E_1'} a_{n,k} \leq \frac{1}{c_n} \sum_{k \in E_2'} a_{n,k} + \frac{1}{c_n} \sum_{k \in E_3'} a_{n,k} + \frac{1}{c_n} \sum_{k \in E_4'} a_{n,k} \quad (69)$$

holds for $n \in N$. Since $c_k = \max\{a_k, b_k\}$, we obtain from (69) that

$$\frac{1}{c_n} \sum_{k \in E_1'} a_{n,k} \leq \frac{1}{a_n} \sum_{k \in E_2'} a_{n,k} + \frac{1}{b_n} \sum_{k \in E_3'} a_{n,k} + \frac{1}{c_n} \sum_{k \in E_4'} a_{n,k}. \quad (70)$$

Taking limit $n \rightarrow \infty$ in (70) together with Lemma 10 and our hypotheses (i) and (ii), one obtains

$$\lim_{n \rightarrow \infty} \frac{1}{c_n} \sum_{k \in E_1'} a_{n,k} = 0 \quad (71)$$

These yields

$$\|M_k(f; x) - f(x)\|_\infty = S_A^{NE} - o(c_k) \quad (72)$$
